Key words: hydroacridines; Schiff bases; macrocycles

Schiff bases are of practical interest as initial materials both for the combinatorial synthesis for libraries of compounds, and for preparation of complexes with metals; thus, currently the intensity of research in this direction is increasing. The possibilities of practical use of complex compounds with organic ligands are quite broad varying from effective catalysts of various chemical processes to molecular sensors. While studying formylation of 5,6,7,8-tetrahydro-1H-spiro[cyclohexane-1,2-quinazolin]-4'(3'H)-one a new domino reaction, which makes it possible to obtain tricyclic acridine systems, has been carried out. In spite of the reduced electrophilicity of the aldehyde groups in 4,5-diformyl-2,3,6,7,8,10-hexahydroacridine-8a(1H)-carbonitrile the latter is shown to react with various amines in benzene with azeotropic removal of water using p-TsOH as a catalyst, and with hydroxylamine hydrochloride in i-PrOH. New Schiff bases and oxime obtained are of potential interest as ligands for formation of chelate complexes. The reaction of dialdehyde with $N_2H_4 \times H_2O$ instead of the expected hydrazone resulted in obtaining a macrocyclic compound – a derivative of hexaazacyclooctadecine. The structure of the compounds obtained corresponds to the data of 1H NMR-spectroscopy, mass spectrometry and elemental analysis. The preliminary studies have shown that azomethines – 4,5-phenyl(cyclohexyl)iminomethyl-2,3,6,7,8,10-hexahydroacridine-8a(1H)-carbonitrile create complexes with copper and nickel ions.

ВЗАЄМОДІЯ 4,5-ДИФОРМИЛ-2,3,6,7,8,10-ГЕКСАГІДРОАКРИДИН-8а(1Н)-КАРБОНИТРИЛУ З Н-НУКЛЕОФІЛАМИ

Ключові слова: гідроакридини; основи Шиффа; макроцикли

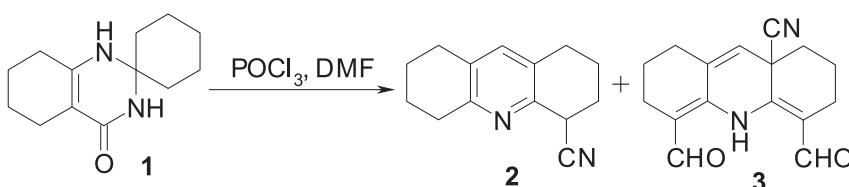

Основи Шиффа становлять практичний інтерес в якості вихідних як для комбінаторного синтезу бібліотек речовин, так і для створення комплексів з металами, і останнім часом інтенсивність досліджень у даному напрямку тільки збільшується. Можливості практичного використання комплексів з органічними лігандами досить широкі: від ефективних каталізаторів хімічних процесів до молекулярних сенсорів. У ході вивчення формілювання 5',6',7',8'-тетрагідро-1Н-спіро[циклогексан-1,2'-хіазолін]-4'(3'H)-ону нами була відкрита нова доміно-реакція, яка дозволяє вийти на трициклічні гідровані акридинові системи. Показано, що незважаючи на знижену електрофільність альдегідних груп у 4,5-дiformил-2,3,6,7,8,10-гексагідроакридину-8а(1Н)-карбонітрилі, він реагує з різними амінами у бензолі з азеотропною відгонкою води з використанням в якості каталізатора p-TsOH, а також з солянокислим гідроксипіаміном у i-PrOH. Отримані основи Шиффа та оксим становлять потенційний інтерес у якості лігандів для утворення хелатних комплексів. У результаті реакції діальдегіду з $N_2H_4 \times H_2O$ замість очікуваного гідразону отримано макроциклічну сполуку – похідну гексаазациклооктадецину. Будова всіх отриманих сполук підтверджена даними ЯМР 1H -спектроскопії, мас-спектрометрії і елементного аналізу. Попередні дослідження продемонстрували, що азометини – 4,5-феніл(циклогексил)іминометил-2,3,6,7,8,10-гексагідроакридин-8а(1Н)-карбонітрилу утворюють комплексні сполуки з іонами никеля та міді.

ВЗАЙМОДЕЙСТВІЕ 4,5-ДИФОРМИЛ-2,3,6,7,8,10-ГЕКСАГІДРОАКРИДИН-8а(1Н)-КАРБОНИТРИЛА С Н-НУКЛЕОФІЛАМИ

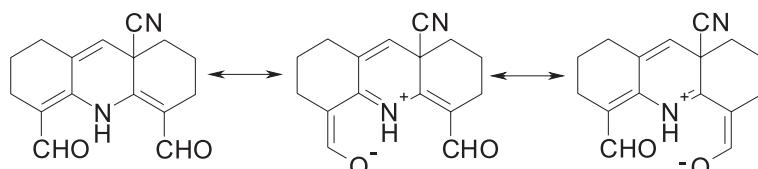

Е.В.Зализна, Т.П.Поліщук, С.А.Варениченко, О.К.Фарат, В.І.Марков

Ключевые слова: гидроакридины; основания Шиффа; макроцикли

Основания Шиффа представляют практический интерес в качестве исходных как для комбинаторного синтеза библиотек веществ, так и для создания комплексов с металлами, и в последнее время интенсивность исследований в данном направлении только увеличивается. Возможности практического использования комплексных соединений с органическими лигандами весьма широки: от эффективных катализаторов различных химических процессов до молекулярных сенсоров. В ходе изучения формирования 5',6',7',8'-тетрагидро-1Н-спіро[циклогексан-1,2'-хіазолін]-4'(3'H)-она нами была найдена новая домино-реакция, которая позволяет выйти на трициклические гидрированные акридиновые системы. Показано, что несмотря на сниженную электрофильность альдегидных групп в 4,5-дiformил-2,3,6,7,8,10-гексагидроакридин-8а(1Н)-карбонитриле, он реагирует с различными аминами в бензоле с азеотропной отгонкой воды с применением в качестве катализатора p-TsOH, а также с солянокислым гидроксипиамином в i-PrOH. Полученные основания Шиффа и оксим представляют потенциальный интерес в качестве лигандов для образования хелатных комплексов. В результате реакции диальдегида с $N_2H_4 \times H_2O$ вместо ожидаемого гидразона получено макроциклическое соединение – производное гексаазациклооктадецина. Строение всех полученных соединений согласуется с данными ЯМР 1H -спектроскопии, масс-спектрометрии и элементного анализа. Предварительные исследования показали, что азометины – 4,5-феніл(циклогексил)іминометил-2,3,6,7,8,10-гексагидроакридин-8а(1Н)-карбонитрила образуют комплексные соединения с ионами никеля и меди.

Scheme 1. Formylation of azine 1 under Vilsmeier-Haack conditions.

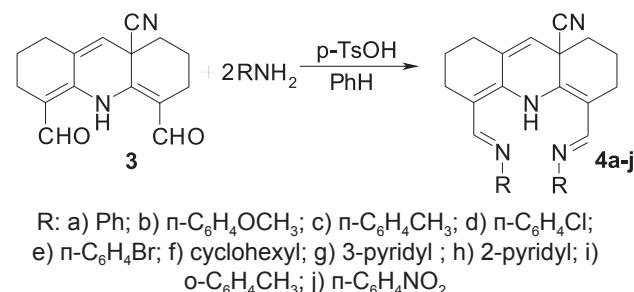

Scheme 2. Localization of the charge in dialdehyde 3.

Recently azomethines, e.g., carbazole series, are widely used as organic ligands [1-9]. It allows obtaining spatial molecules with binding transition metal centres. On the basis of the complexes the highly effective nanoscale sensors can be created. Therefore, it is very important to synthesize precursors, in particular Schiff bases, with a suitable geometry to create chelate complexes with metals. Earlier when studying formylation of various azine and oxazine systems the domino-reaction – rearrangement of spiro-quinazoline 1 into tricyclic acridine systems 2 and 3 was found [13] (Scheme 1). In our previous papers the results of studying the reactivity of carbonitrile 2 were presented [14-15]. However, the synthetic potential of 4,5-diformyl-2,3,6,7,8,10-hexahydroacridine-8a(1H)-carbonitrile 3 has remained completely unstudied.

Due to the peculiar structure of dialdehyde 3 and based on its obtaining of the Schiff bases required for complexation geometry has become possible. According to the data of ¹H NMR-spectroscopy the formyl group forms a hydrogen bond with proton of the nitrogen endocyclic atom, and it is proven by the strong chemical shift of its signal in the lowest field values (δ 13.03 ppm). In the IR-spectrum the decrease in the absorption frequency to $\nu = 1667\text{ cm}^{-1}$ confirms that formyl groups are in conjugation with the N-H group, it is supposed to lead to a decrease in the reactivity of CHO-groups. According to the data of X-ray diffraction analysis C=O bonds are longer in 1.219 Å than the standard C=O double bond distance in aldehydes – 1.192 Å. From the analysis of the structures (Scheme 2) it is obvious that the electrophilicity of carbon atoms in carbonyl groups is significantly lower compared to the aldehyde group unconjugated with an electron-donating substituent. Consequently, aldehyde groups in dialdehyde 3 are vinylogs of amides and, taking into account their low reactivity, it is interesting to study the possibility of forming Schiff bases.

Among several variants of the reaction [16-18] the method of boiling with various amines in benzene

Scheme 3. The synthesis of Schiff bases 4a-j.

with azeotropic water distillation with *p*-TsOH as a catalyst has been chosen (Scheme 3).

The reaction of dialdehyde 3 with the excess of amine and the catalytic amount of a catalyst lasts for 15 min and results in a good yield of Schiff bases 4a-j. The structure of compounds 4a-j obtained corresponds to the data of ¹H NMR-spectroscopy, mass spectrometry and elemental analysis (Tab. 1, 2). The signal for the NH proton in the spectra of compound 4a-j is observed as a broadened singlet in the down-field region at about ~ 12.5 ppm, the characteristic signal of the olefin CH-proton [19] is observed as a singlet in the region at about ~ 6 ppm, in the range of 8.1 and 8.6 ppm there are signals of two azomethine protons CH=NR.

The reaction of dialdehyde 3 with hydroxylamine hydrochloride resulted in obtaining a colourless 4,5-bis[(E)-(hydroxyimino)methyl]-2,3,6,7,8,10-hexahydroacridine-8a(1H)-carbonitrile 5, being of interest as an organic ligand due to its structure (Scheme 4).

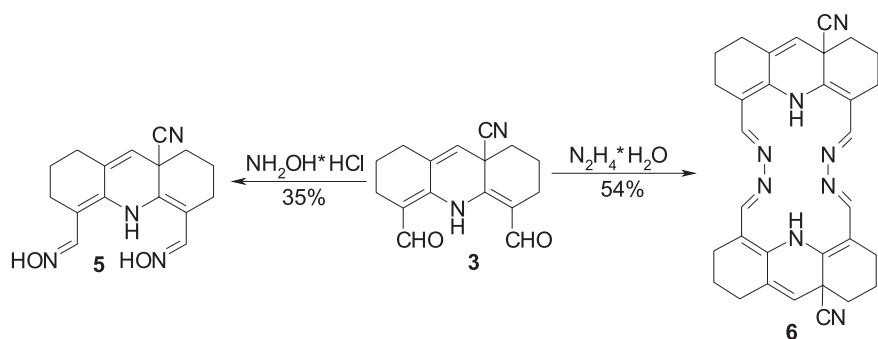

The reaction of dialdehyde 3 with hydrazine hydrate resulted in formation of condensation product 6 – 2,3,5,7,8,9,15,16,18,19,20,21,22-dodecahydro-4,6:19,17-dimethenotetrabenzo[d,g,m,p][1,2,6,10,11,15]-hexaazacyclooctadecine-4,19(1H,14H)-dicarbonitrile characterized with a saturated dark red colour in the solution (Scheme 4). This structure was proposed on the basis of ¹H NMR- and mass-spectra. The signals for NH-groups protons in the NMR-spectra are observed as broadened singlets in the downfield region

Table 1Yields, MP and elemental analysis of compounds **4a-j; 5-6**

Scheme 4. The synthesis of dioxime 5 and macrocycle 6.

(11.3 ppm), there are also the signals of azomethine protons (δ 7.64 and 7.70 ppm). In mass spectrum the peaks of appropriately protonated molecular ions $[\text{MH}]^+ = 528$ Da are observed.

Experimental Part

The ^1H NMR-spectra of compounds were recorded in DMSO-d_6 on a Varian VXR 200 instrument (200 MHz). The internal standard for all NMR-spectra was TMS. The FAB spectra were recorded with the use of a VG7070 spectrometer. Desorption of ions from the solution of the samples in *meta*-nitrobenzyl alcohol was performed with a beam of argon atoms with energy of 8 keV. Elemental analysis was performed on a LECO CHNS-900 instrument. The reactions and the purity of the compounds obtained were monitored by TLC on Merck Silicagel 60 F-254 plates with CHCl_3 - 2-PrOH (10:1) as an eluent.

The synthesis of Schiff bases 4a-j (general method): Dissolve the mixture of the diformyl derivative 3 (2.68 g, 0.01 Mol), 0.02 Mol of amine and 0.3 g of p-TsOH in benzene (200 mL), reflux for 15 min with continuous removal of water using the Dean-Stark trap. Cool the reaction mixture, evaporate the solvent (~160 mL). Filter the precipitate, and recrystallize from benzene.

4,5-Bis[(E)-(hydroxyimino)methyl]-2,3,6,7,8,10-hexahydroacridine-8a(1H)-carbonitrile (5): Dissolve diformyl derivative 3 (2.68 g, 0.01 Mol) in

30 mL of *i*-PrOH, add 1.7 g (0.025 Mol) of hydroxylamine hydrochloride, and reflux for 2 h. Cool the reaction mixture to 10°C. Filter the precipitate of product 5, and recrystallize from acetonitrile.

The NMR-spectra, δ , ppm: 10.64 (1H, s, NH); 8.74 (1H, s, OH); 8.43 (1H, s, OH); 6.27 (2H, s, $2\text{CH}=\text{NR}$); 5.56 (1H, s, CH); 2.31-2.38 (4H, m, 2CH_2); 1.63-1.81 (8H, m, 4CH_2).

2,3,5,7,8,9,15,16,18,19,20,21,22-dodecahydro-4,6:19,17-dimethenotetrabenzo[d,g,m,p][1,2,6,10,11,15]-hexaazacyclooctadecine-4,19(1H,14H)-dicarbonitrile (6): Dissolve diformyl derivative 3 (2.68 g, 0.01 Mol) in 1,4-dioxane, add 0.02 Mol of hydrazine hydrate, and reflux for 30 min. Cool the solution to the room temperature, and add water. Filter the precipitate of product 6, and recrystallize from DMF.

Conclusions

Thus, this paper shows the possibility of the synthesis of Schiff bases using the reaction of 4,5-difomyl-2,3,6,7,8,10-hexahydroacridine-8a(1H)-carbonitrile with various amines under acid catalysis with azeotropic removal of water. The reaction of dialdehyde with $\text{N}_2\text{H}_4 \times \text{H}_2\text{O}$ resulted in obtaining a macrocyclic compound – a derivative of hexaazacyclooctadecine instead of the expected hydrazone. The preliminary studies have shown that products 4a and 4f form complexes with copper and nickel ions. The results of the study will be presented in ongoing papers.
